Important

I used React Native to build this project, to cut down on the project size, I left it as a ReactNative project with JS files since it's easier to test as well.
If you want to use it as a native mobile app, then run `npm run eject` follow the prompts then use `npm run ios` it will take a **long** time to build, but at the end you'll get a native app.

How to use

Cloud

1. If you don't have NodeJS installed, you need Node > 8.9.0
2. Switch to `cloud` directory, and then run `npm install && node in dex.js`
3. It runs on `localhost:3009` by default

Mobile

1. Again, you need NodeJS
2. Switch to `Mobile` directory and run `npm install && npm run ios`
3. Switch from the AWS server URL in the `config/api.js` file to go back to the localhost URL if you want to test locally.
